

A bél normál baktérium flórája

Enterobacteriaceae

Dr. Berek Zsuzsa
04 November 2009

GRAM NEGATÍV PÁLCÁK

AEROB

Bordetella

Brucella

Francisella

Pseudomonas

Acinetobacter

Legionella

FACULTATIV ANAEROB

Haemophilus

Pasteurella

Familia:

Enterobacteriaceae

Vibrionaceae

Cardiobacterium

Eikenella

Kingella

Actinobacillus

ANAEROB

Bacteroides

Prevotella

Porphyromonas

Fusobacterium

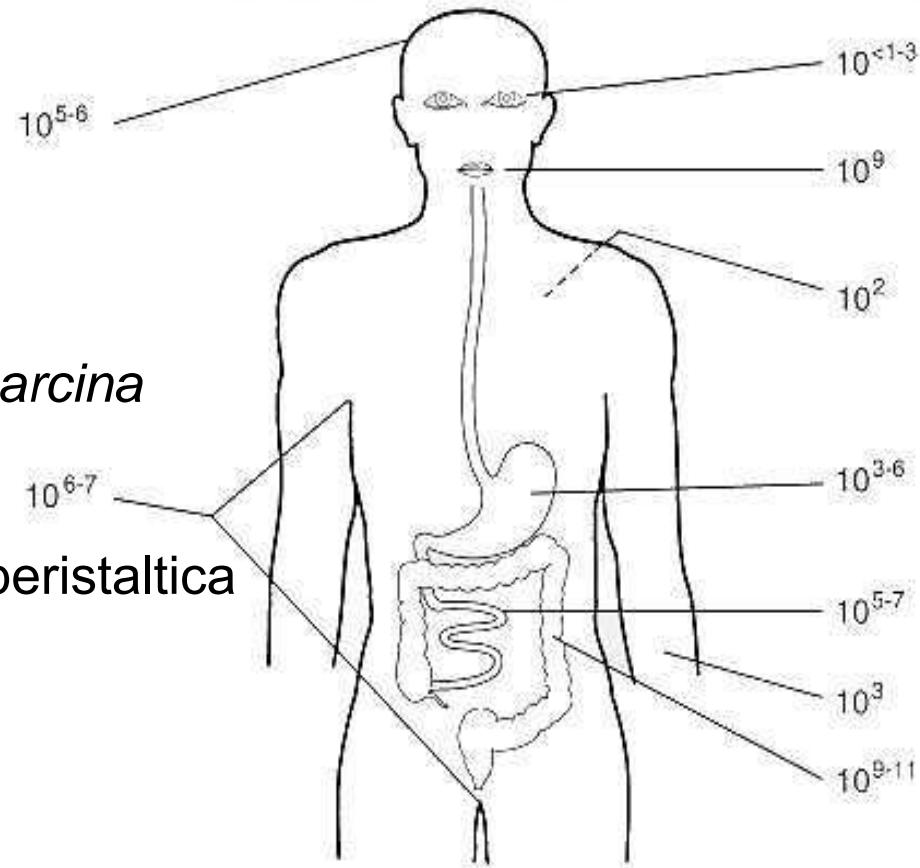

MICROAEROPHIL

Campylobacter

Helicobacter

A bél normál flórája

- **Jelentőség:**
csíramentes állat kísérletek
- **gyomor** (10^3 – 10^6 cfu/g)
 - alacsony pH
 - Residens micro flora Ø
 - Transiens flora +
 - Hypochlorhydria, stasis ⇒
Lactobacillus (Boas-Oppler) & *Sarcina*
spp.
- **vékonybél** (10^5 – 10^7 cfu/g)
 - emésztő enzymek & epe, gyors peristaltica
 - Residens micro flora Ø
 - Transiens flora +
- **vastagbél** (10^9 – 10^{11} cfu/g)
 - Residens micro flora

Normál baktérium flóra - vastagbél (>400 Species)

Anaerobok

A fajok 90–95%
 10^{11} cfu/g faeces

Residens flóra

Bifidobacterium bifidum

Bacteroides fragilis

Eubacterium spp.

Clostridium spp.

Transiens flóra

Anaerob coccusok

Fusobakteriumok

Lactobacillusok

Facultative anaerobok

A fajok 5–10%
 $\sim 10^3$ – 10^9 cfu/g faeces

Residens

Escherichia coli

Enterococcus spp.

Transiens

Klebsiella spp.

Enterobacter spp.

Proteus spp.

Providencia spp.

Pseudomonas spp.

Bacillus spp.

élesztőgombák, Protozoa

A vastagbél normál flórája - kialakulás

- Szoptatás, anyatej
 - Residens
 - Bifidobacteria (pH 5,5)
 - Más fajok kolonizációja gátolt (vitamin K pótlás!)
- Normál táplálkozás
 - előbb
 - Facultative anaerobok
 - később
 - *Bacteroides fragilis*

Scanning electron micrograph of the colon mucosa of rat

Magnification: 262×

| : bacterium layer, L: lumen,
B: bacteria,
T: intestinal tissue

Magnification: 2.624×

A normál vastagbél flóra szerepe, jelentősége

- Tápanyagok bontása, enterohepaticus recirculatio (epe)
- Vitamin termelés: vitamin K & B-complex
- Gáz termelés ⇒ distensio ⇒ normal peristaltica
- folyamatos fizikai & kémiai stimuláció ⇒ folyamatos mucosa turnover
- Biofilm formatio, epithelialis receptorok gátlása, tápanyag competitio, bacteriostaticus termékek ⇒ pathogen bacteriumok colonisatiojának gátlása
- Constats antigen stimulus ⇒ az immunrendszer extrauterin fejlődése és működése

A normál vastagbél flóra szerepe – kóros folyamatokban

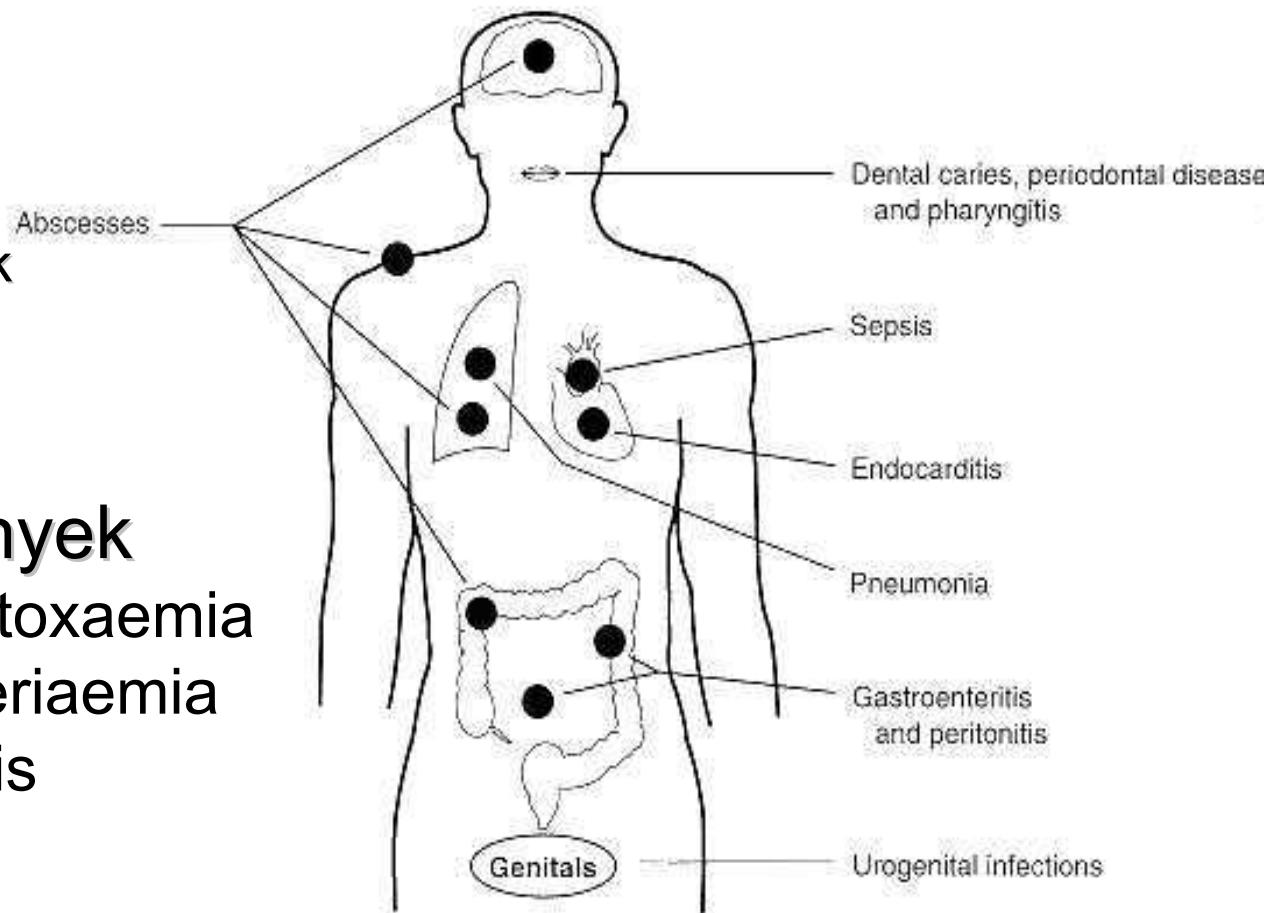

- Extra intestinalis fertőzések

- Translocatio

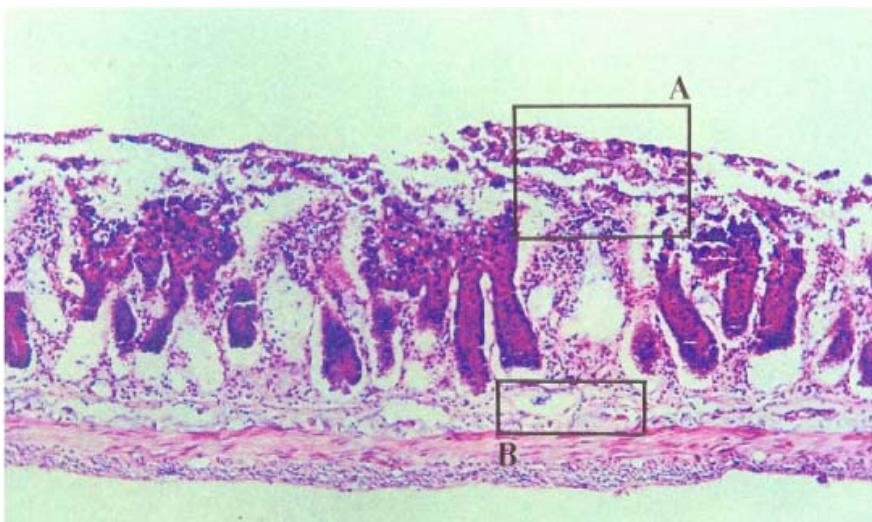

- ❖ Immune kompromittált betegek
- ❖ Obstructio
- ❖ Shock

- ❖ következmények

- Endotoxaemia
- Bacteriaemia
- Sepsis

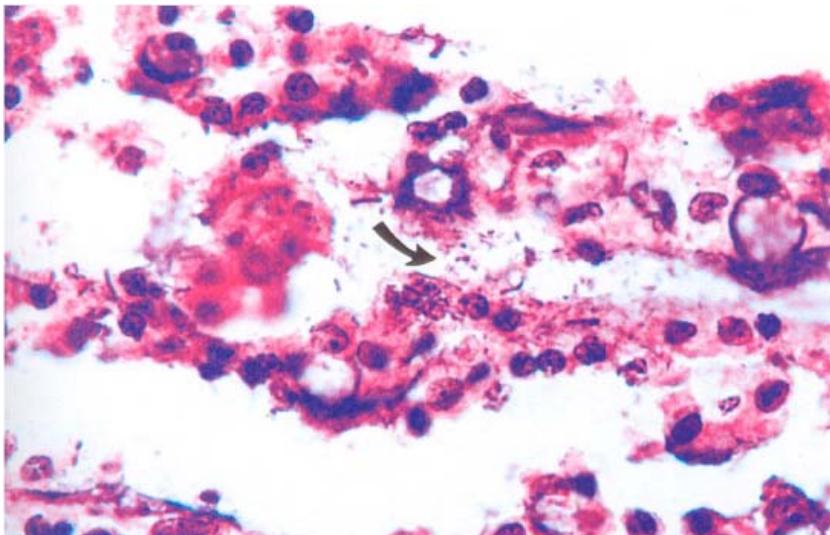

Bacterial translocation in rat after experimental intestinal obstruction

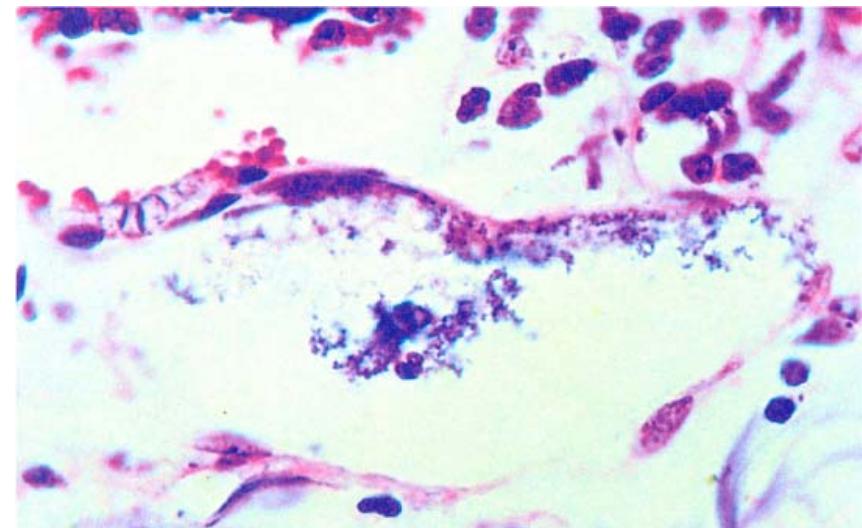

A: lifting of the epithelial cells from the lamina propria & bacterial invasion

B: cocci and rods in the submucosal lymphatic vessels

A

B

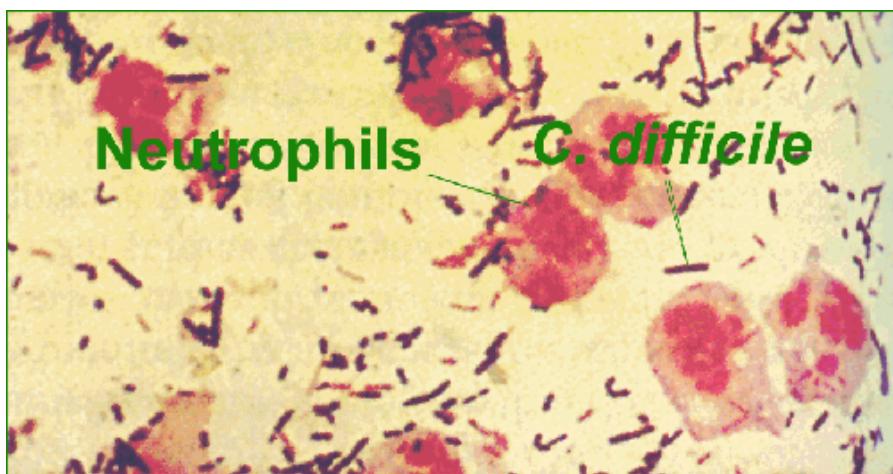

A normál vastagbél flóra egyensúlyának megváltozása

- **okai**
 - alultápláltság
 - Széles spektrumú *per os* antibiotikum terápia
- **következmények**
 - Emésztési zavar & maladsorptio, vitamin hiány
 - normal peristaltica megváltozása,
gastrointestinalisan a gáz képződés emelkedése
- **Antibioticum associált hasmenés**
 - enyhe: „közönséges” hasmenés
 - súlyos: **pseudomembranous colitis**
(*Clostridium difficile*)

Pseudomembranous colitis

Thickened wall of the colon transversum

C. difficile & neutrophils

Characteristic yellow plaques

**Gram negatív fakultatív
anaerob pálcák**

Enterobiacteriaceae

Enterobacteriaceae

Morphologia: - Gram negative pálcák
- pili
(ex.: Klebsiella, Shigella)

Tenyésztés:

egyszerű (Agar, véresagar) Media

Differenciálás: pathogenic-facultative pathogenic
(biokémiai reakciók)

- a) Selective táptalajok
- b) Differential táptalajok
- c) Indicator táptalajok

Enterobacteriaceae

Antigenek és Virulencia faktorok:

O (sejtfal)

H (Flagella)

K (tok)

felszíni Proteinek

Pilusok

Exotoxin

Endotoxin

Enterobacteriaceae

**Facultative pathogenek
genus
*Escherichia***

Klebsiella csoport

Enterobacter

Edwardsiella

Citrobacter

Proteus csoport

Serratia

Providencia

Morganella

Obligate pathogens (genera)

E. Coli

ETEC (enterotoxic)

EPEC (enteropathogen)

EIEC (enteroinvasive)

EHEC (enterohemorrhagic)

EAggEC (enteroaggregativ)

Shigella

S. dysenteriae

S. flexneri

S. boydii

S. sonnei

Salmonella

S. typhi

S. paratyphi

Yersinia

Y. pestis

Y. pseudotuberculosis

Y. enterocolitica

Enterobacteriaceae – fakultatív pathogének

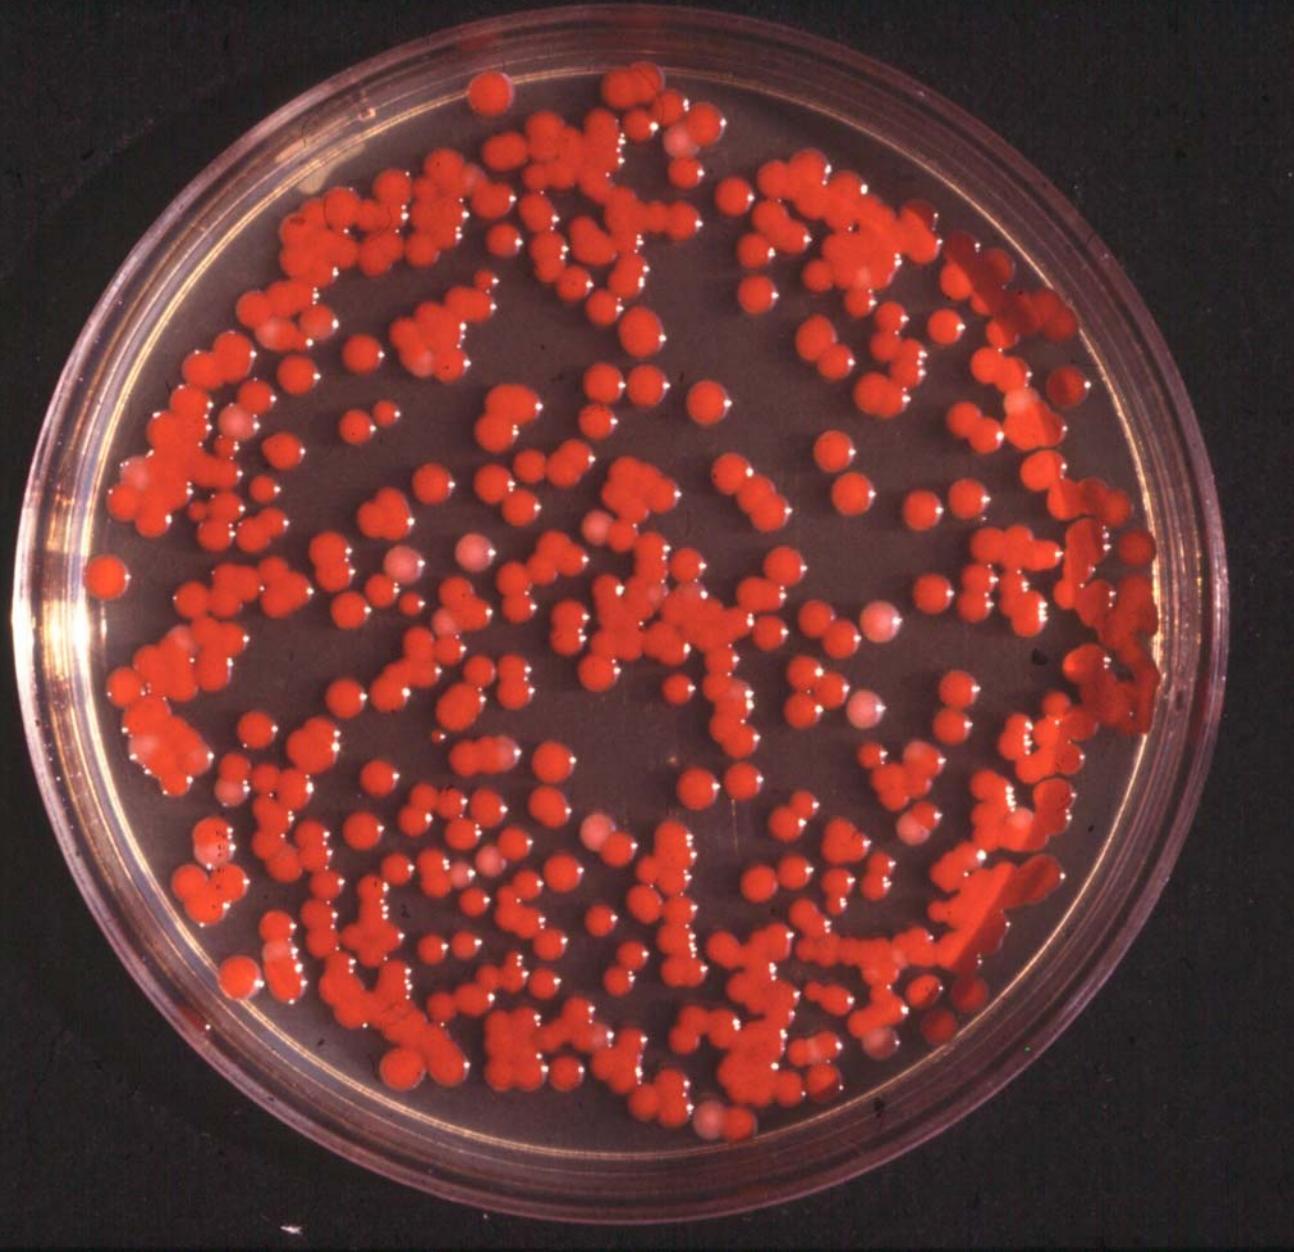

***Klebsiella, Proteus, Escherichia* etc.**

Extraintestinalis kórképek – MIND!!! gennyes gyulladás:

- a) húgyúti fertőzések
- b) cholecystitis, cholangitis
- c) peritonitis (localis, diffus)
- d) pneumonia
- e) meningitis
- f) sebfertőzések
- g) sepsis
- h) iatrogen/nosokomialis fertőzések

Diagnosis: izolálás, identifikálás

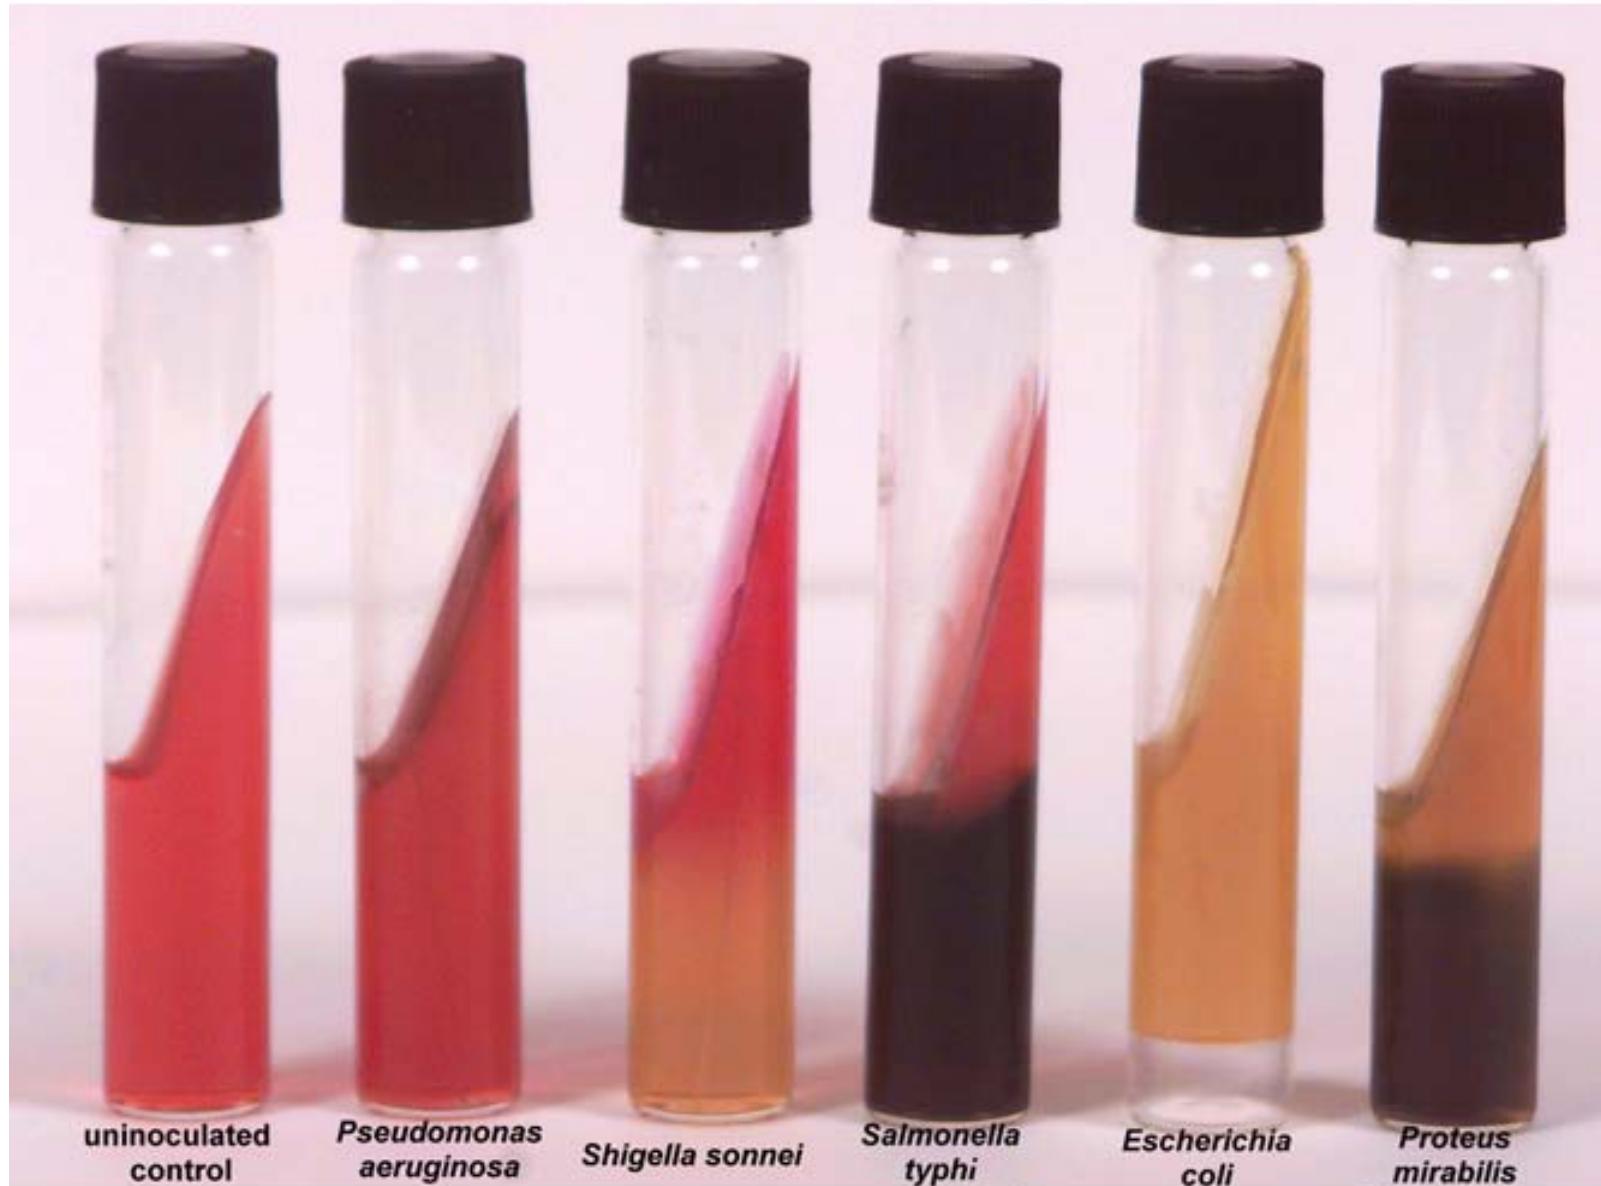

Therapia: antibiogram (ESBL)

Serratia marcescens - *Serratia marcescens* Durch Prodigiosin rot gefärbte Kolonien von *Serratia marcescens* auf Agargel.

TSI Medium

azonosítás

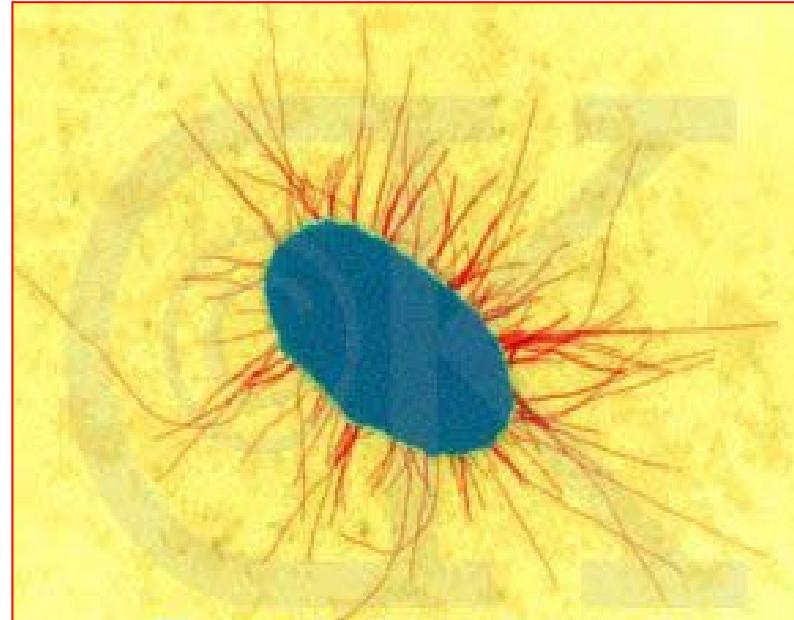

Top row, *Proteus vulgaris*; second row, unidentified enteric bacterium; third row, *Klebsiella pneumoniae*; bottom row, *Vibrio alginolyticus*.

Urinary tract infections (UTI) húgyúti fertőzések

- ***E. coli* (80%)**
 - Predispositio
 - Ascendáló
(ritkán haematogen)
 - Cystitis, pyelonephritis
 - **Virulencia faktotrok** (UPEC - törzsek)
 - Haemaggl. Adhesio-s fimbriae
 - Mannose resistens (MR) fimbriae
(F-antigen),
P-fimbriae (vércsoport P) ⇒
pyelonephritis
 - Mannose sensitive (MS) fimbriae ⇒
cystitis
 - Haemolysinek

E. coli with Fimbriae

Urinary tract infections (UTI)

P. mirabilis: rajzás

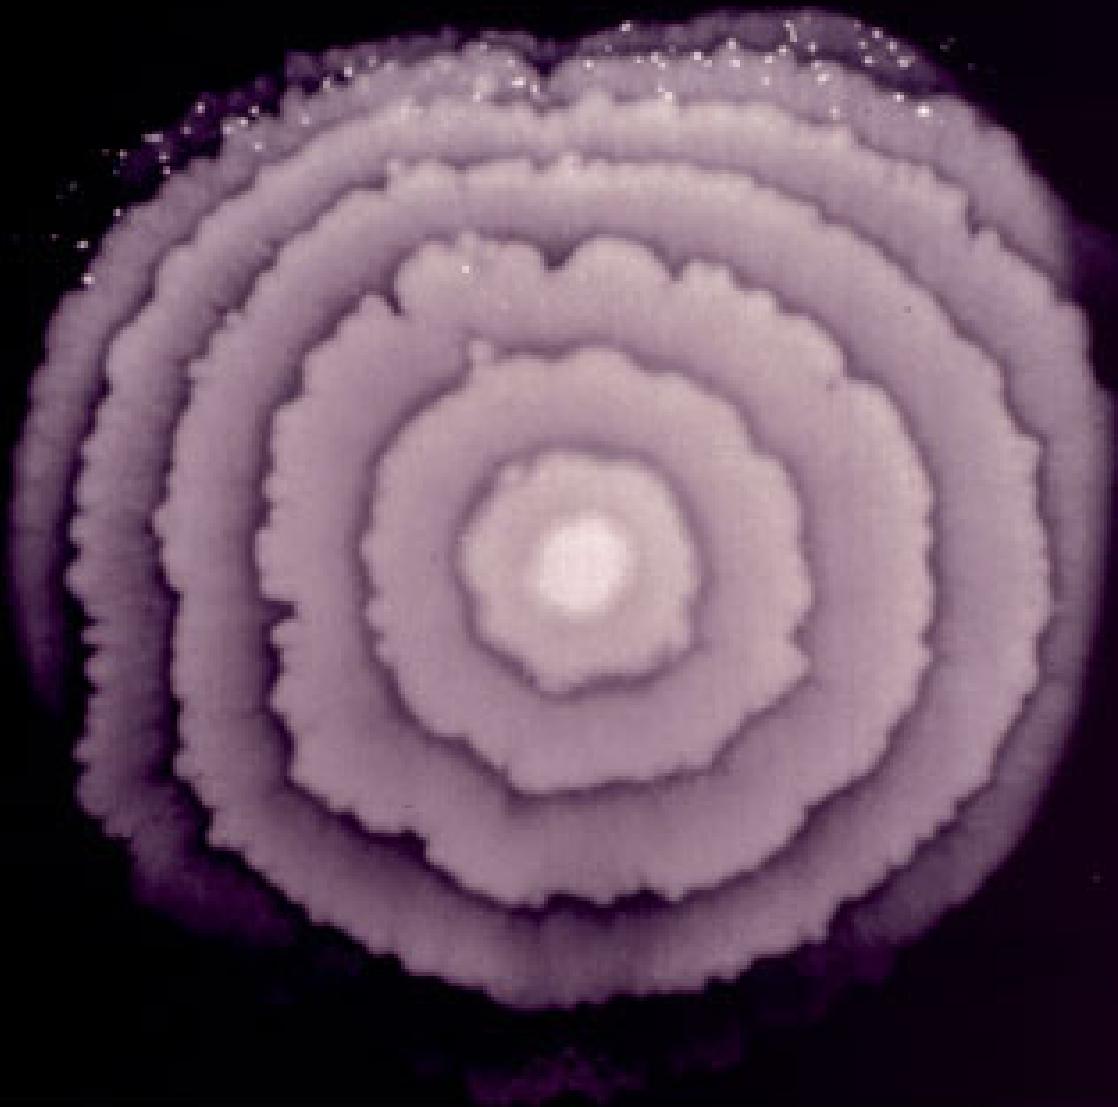

- ***P. mirabilis*, *P. vulgaris***

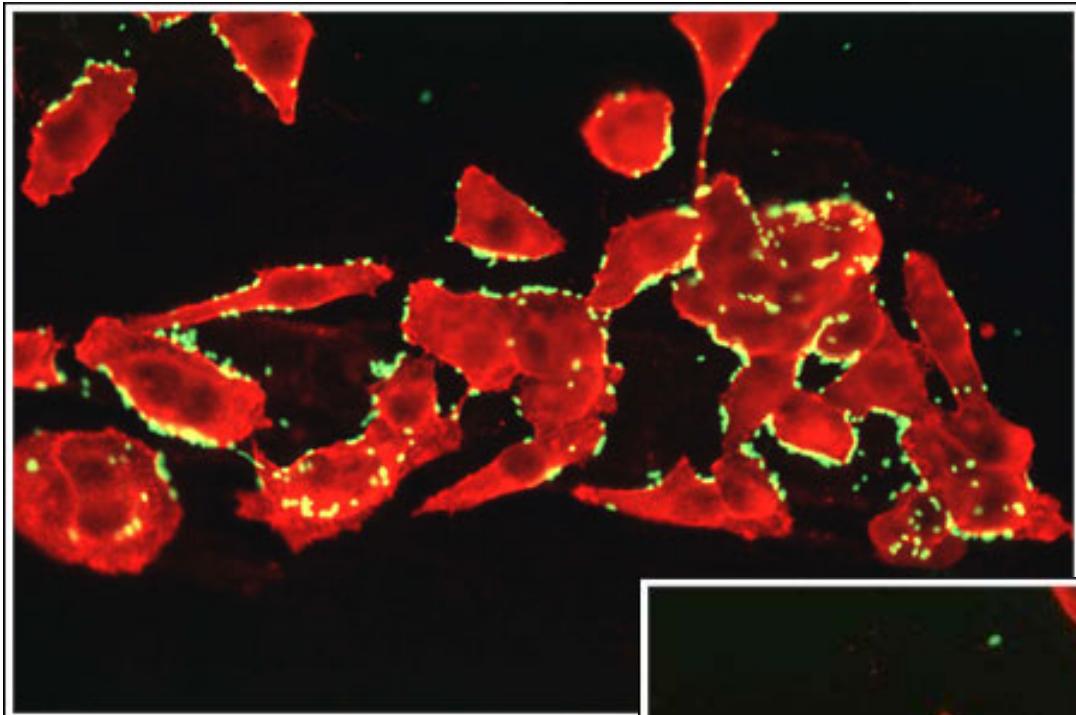

- Predispositio
- Ascendáló fertőzés
- Nosokomialis
(catheter, operatio)
- **Virulencia faktorok**
 - Flagellae:
motilitas
 - Adhesio-s fimbriae
 - Urease
($\text{pH} \uparrow$, irritatio, kőképződés)

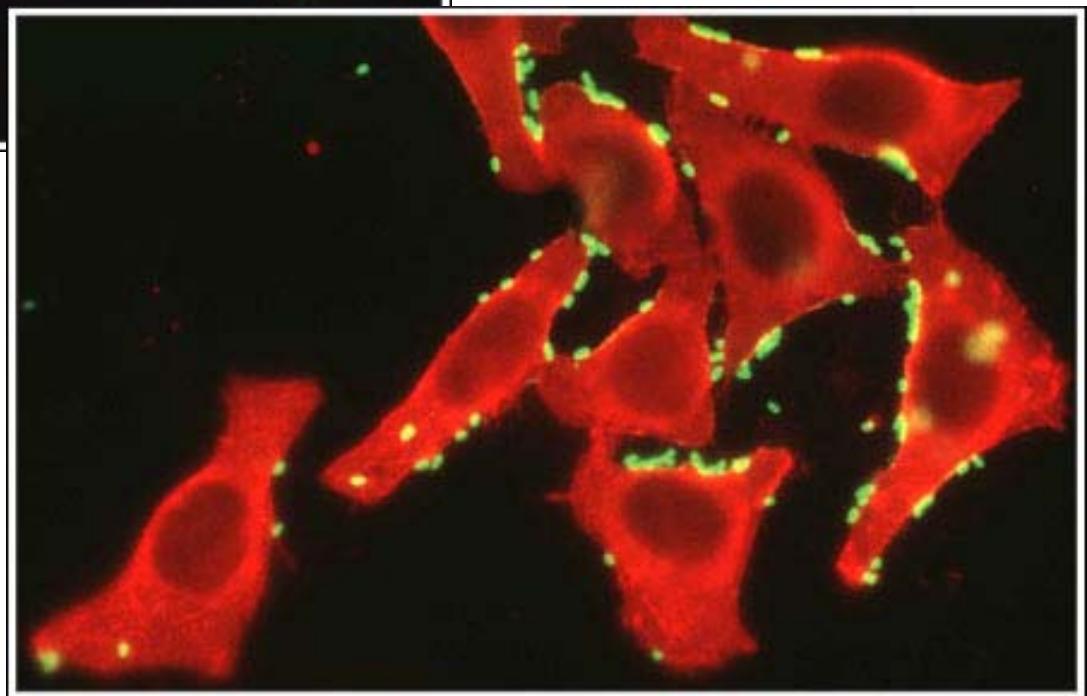

P. mirabilis

rajzás

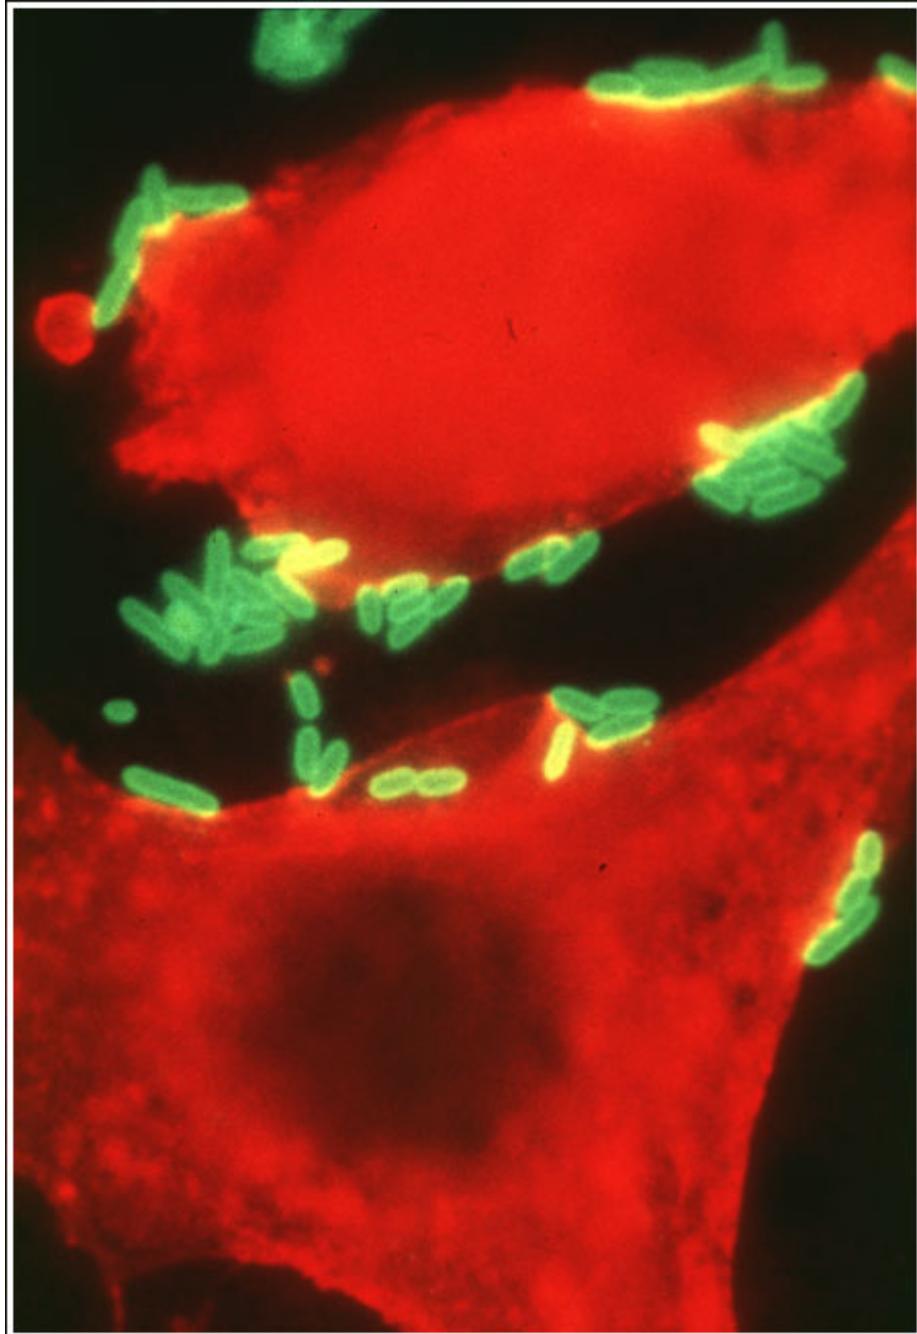

P. mirabilis

rajzás
- sejtekben

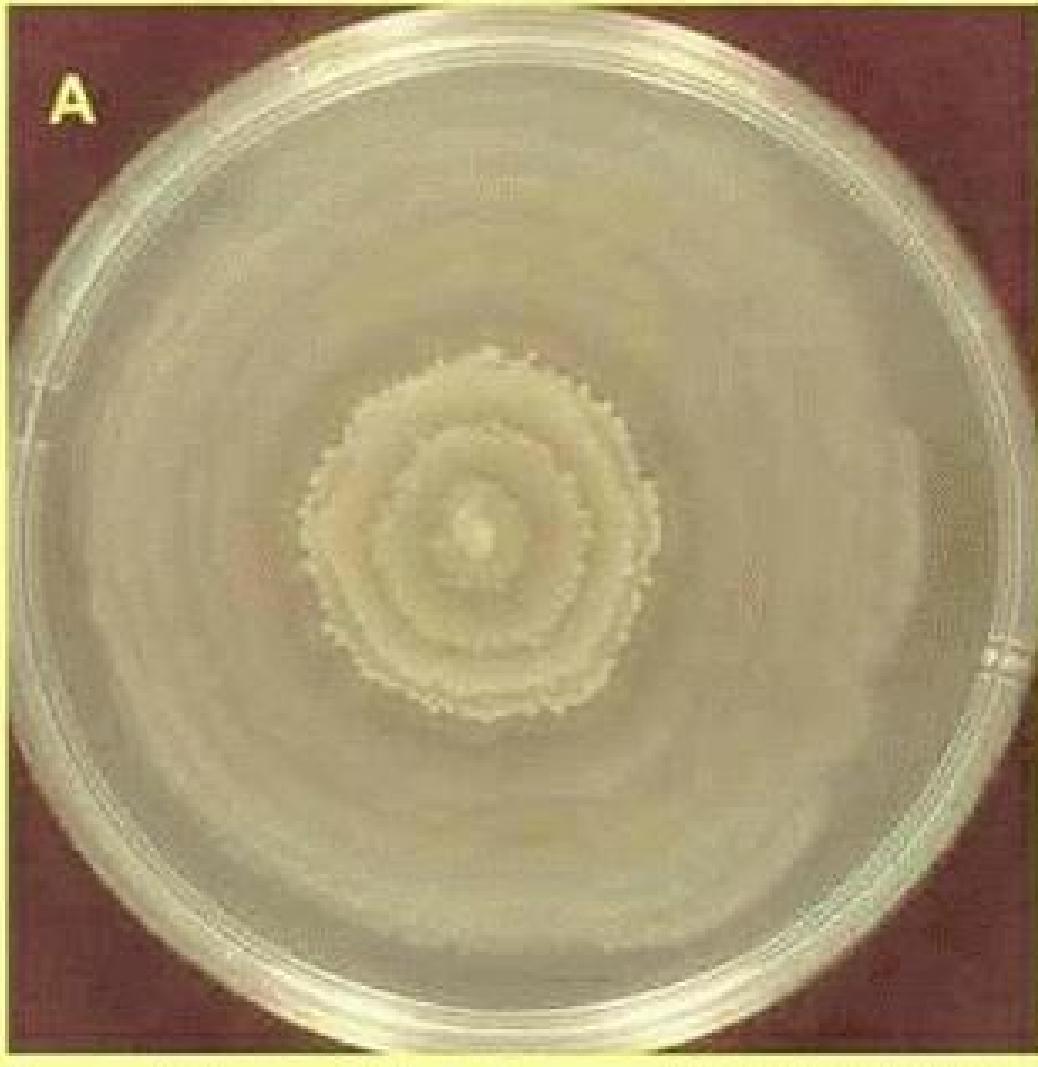

P. mirabilis

rajzás
- sejtekben

Proteus vulgaris csillófestés

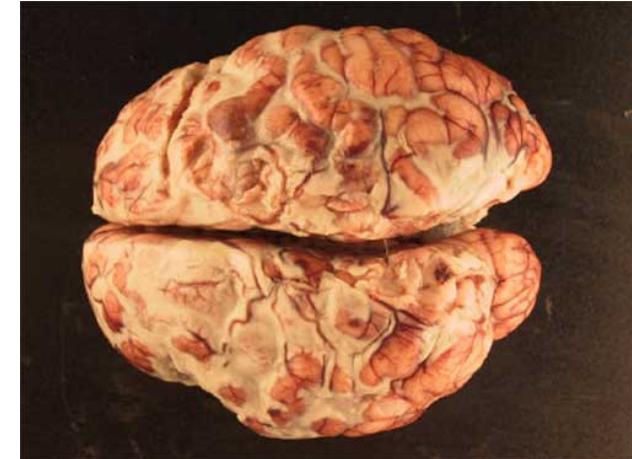

A: *Proteus*, *Providentia* – B: Urease Test - / +

Újszülöttkori Meningitis & Sepsis

- ***E. coli K1***
(80–85%)
- K1-antigen
 - Azonosság
Meningococcus B-ag
 - Tolerancia ⇒
nincs ellenanyagválasz
 - Translocatio

Pneumonia

- Nosokomial
- Predispositio
- kórokozók
