Dental amalgam: characteristic, toxicity and clinical use

Dr. Zsuzsanna Tóth Ph.D.

Caries therapy

Requirements

- ↳ Biocompatibility
- ↳ Adequate mechanical properties:
 - press, strain, flex coefficient, resistivity
 - elasticity
 - surface hardness
 - abrasion resistance
- ↳ Shape/form and volume stability
 - tooth-similar thermal expansion

Caries therapy

Requirements

- ↳ Resistance against humidity, indissolubility, bonding
- ↳ Thermal and electrical isolation
- ↳ Antiseptic effect, caries-prophylactic properties
- ↳ Radiopacity
- ↳ Tooth-similar optical properties
- ↳ Simple application, finishing, polishing
- ↳ Easy removal
- ↳ Low price

Restorative dental materials

- ↳ Temporary restorative materials
- ↳ Liners and bases
- ↳ Definitive restorative materials
 - Direct restorative dental materials (plastic)
 - Amalgams
 - Cement
 - Cermet Cement
 - Polymers
 - Composite
 - Indirect restorative dental materials (solid)
 - Metal
 - Ceramic
 - Glass-ceramic
 - Direct Ceramic (Cerec ...)
 - Gold-ceramic
 - Composite

Indirect restorations

and clinical use

Ass. Prof.
Dr. Zsuzsanna Tóth Ph.D.

Amalgam

An alloy of mercury with any other metal

Dental amalgam:

mercury and silver-tin alloy,
plus copper and zinc

biner, tertier, quaterner etc.

amalgams

Classification

in terms of

- » Dental amalgam alloy particle geometry and size
- » Copper content
- » Zinc content

Classification

in terms of

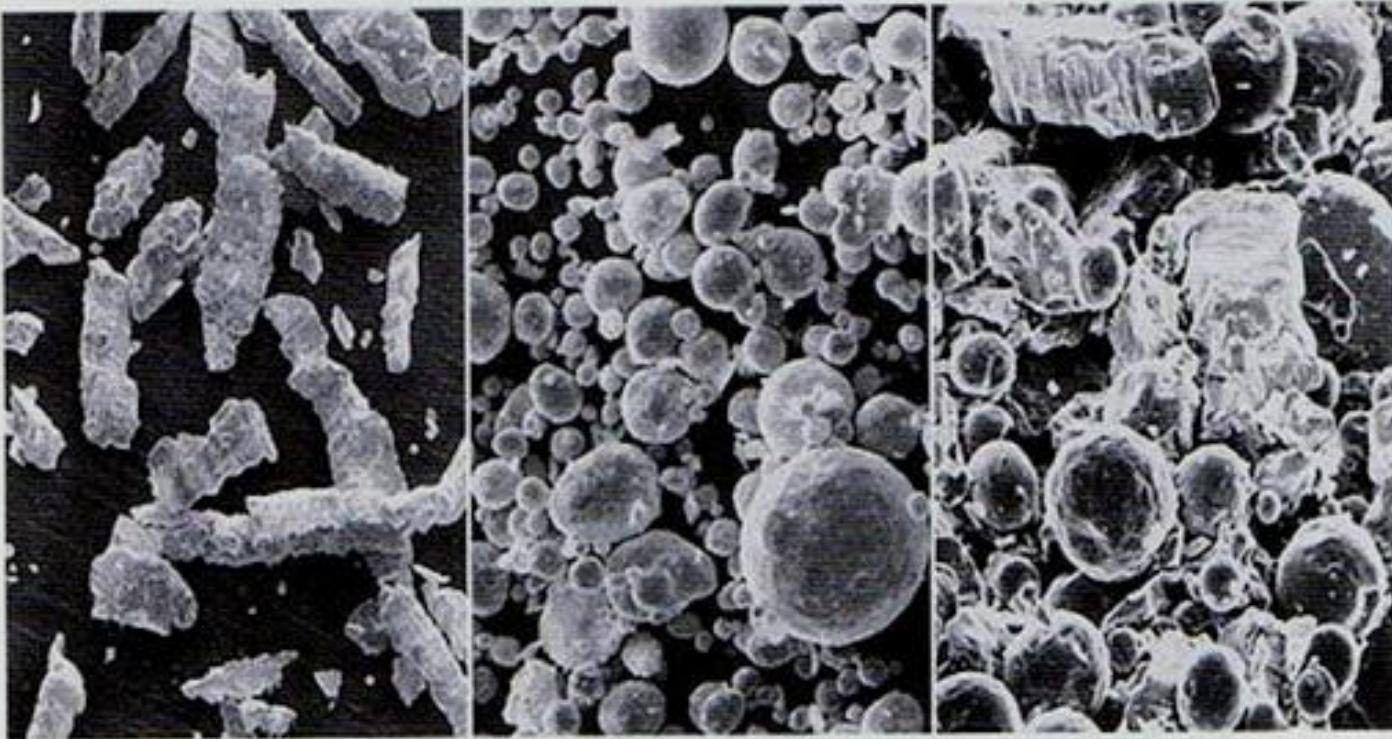

- » Dental amalgam alloy particle geometry and size

- filings
- lathe-cut particles
- spherical
- mixed geometries

- » Copper content

- » Zinc content

A

B

C

→ Micrographs of alloy particles. **A**, Irregular. **B**, Spherical. **C**, Admixed with irregular and spherical particles.

Dental amalgam: characteristic, toxicity
and clinical use

Ass. Prof.
Dr. Zsuzsanna Tóth Ph.D.

Classification

in terms of

- » Dental amalgam alloy particle geometry and size
- » Copper content
 - Low-copper dental amalgams
2-5 %
 - High-copper dental amalgams
12-30 %
- » Zinc content

Classification in terms of

- » Dental amalgam alloy particle geometry and size
- » Copper content
- » Zinc content
 - Zinc-containing
 - Zinc-free

Materials properties

↳ Physical properties

↳ Mechanical properties

↳ Chemical properties

↳ Biological properties

Materials properties 1.a.

↳ Physical properties

- Mass
- Thermal
- Electrical
- Optical
- Surface properties

↳ Mechanical properties

↳ Chemical properties

↳ Biological properties

Materials properties 1.b

↳ Physical properties

→ Coefficient of thermal

expansion/contraction

→ percolation (egress/ingress of fluids)

→ heat flow – thermal conductivity

→ Electrical conductivity

→ Mass properties density

→ Optical properties – color, radiopacity

→ Surface properties

Materials properties 2.

- ↳ Physical properties
- ↳ Mechanical properties
 - Stresses and strains within a material as a result of an external force
 - Response to loading, compression, tension, shear, torsion, flexion, hardness
- ↳ Chemical properties
- ↳ Biological properties

Materials properties 3.

- ↳ Physical properties
- ↳ Mechanical properties
- ↳ Chemical properties
 - Chemical and electrochemical interactions
 - Chemical and electrochemical corrosion
- ↳ Biological properties

Materials properties 4.

- ↳ Physical properties
- ↳ Mechanical properties
- ↳ Chemical properties

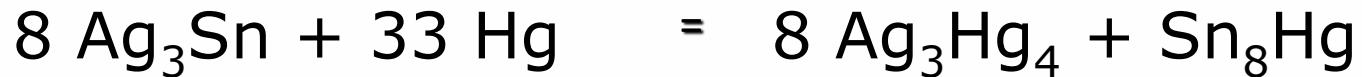

↳ Biological properties

Characterization of

- toxicity (threshold level) and
- sensitivity reaction during clinical use

Jörgensen - equation

Y

Y₁

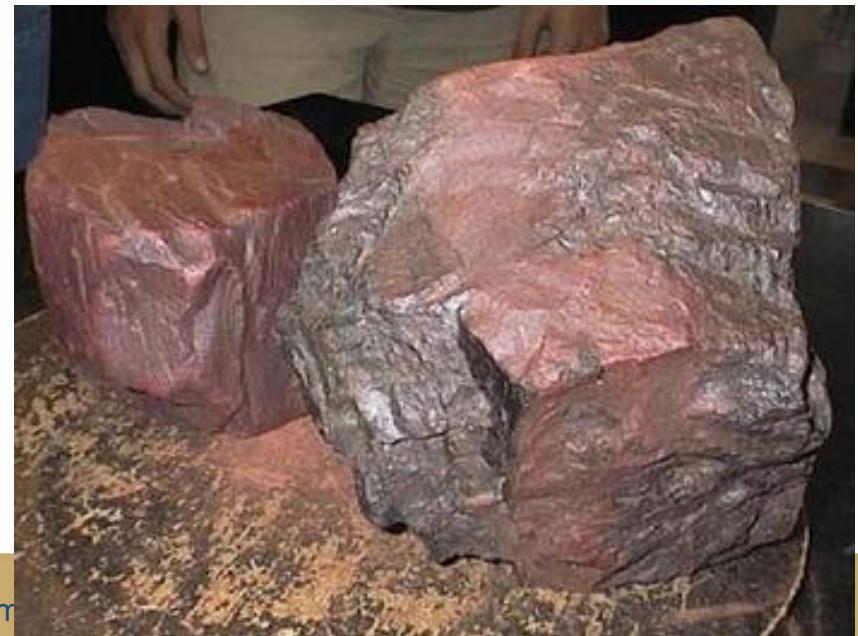

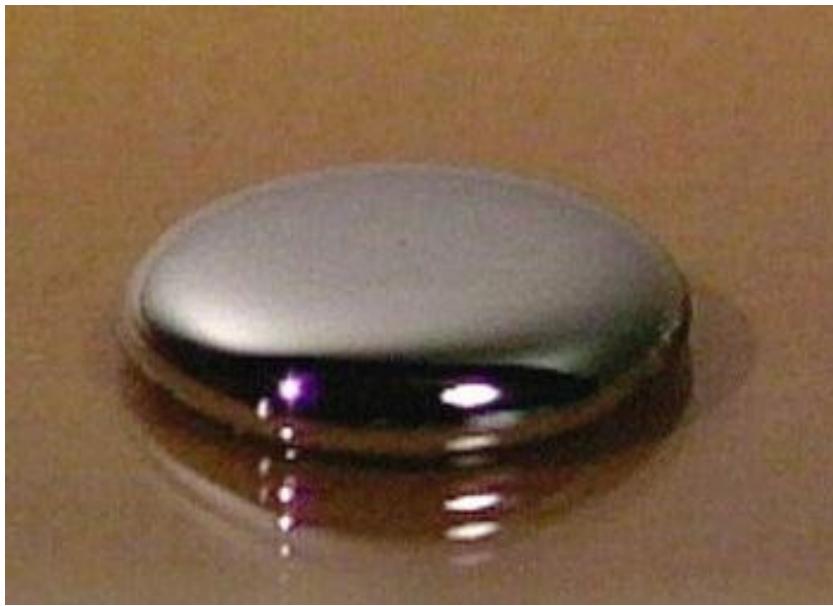

Y₂

Y₂ phase is responsible for:

- Corrosion
- Discolouration
- Marginal fracture
- Creep

Dental amalgam: characteristic, toxicity
and clinical use

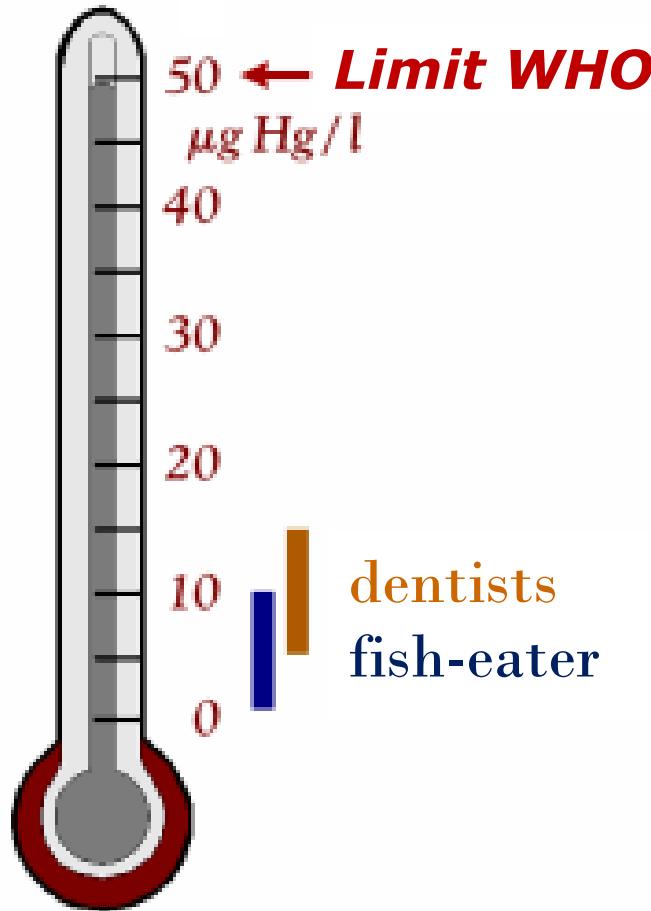

Dr. Zsuzsanna Iotn Pn.D.

Properties of dental amalgams

1. volumetrical stable
2. indissoluble
3. mechanical resistance
4. ductility
5. *thermal and electrical conductivity*
6. *corrosion*
7. non-toxic!!!! (inorganic)
sensitivity (allergy): rare
8. radiopacity
9. *colour*
10. amalgam with F⁻-content
11. price

Mercury in urine

Dental amalgam: characteristic, toxicity
and clinical use

Ass. Prof.
Dr. Zsuzsanna Tóth Ph.D.

Toxicology of amalgam

Also the American Dental Association U.S. Centers for Disease Control and Prevention and World Health Organization all agree that based on extensive scientific evidence, dental amalgam is a safe and effective cavity-filling material.

Toxicology of amalgam

Minamata disease

- ➡ Chisso-Minamata disease, is a neurological disease caused by severe mercury poisoning. Signs and symptoms include ataxia, numbness in the hands and feet, general muscle weakness, loss of vision, and damage to hearing and speech. In extreme cases, insanity, paralysis, coma, and death follow within weeks of the onset of symptoms. A congenital form of the disease can also affect fetuses in the womb.

Minamata disease

- ↳ It was caused by the release of the industrial wastewater from the Chisso chemical factory.
- ↳ The inorganic mercury in the wastewater was metabolized to organic methylmercury by bacteria in the sediment.
- ↳ This highly toxic chemical bioaccumulated in shellfish and fish in Minamata Bay and was eaten by the local population, and animals, and resulted in mercury poisoning.
- ↳ The human and cat, dog, pig deaths continued for 36 years, Chisso and the Kumamoto prefectural government did little to prevent the epidemic.
- ↳ The animal effects were severe enough in cats that they came to be named as having "dancing cat fever".

Rules of protection in dentistry

- ↳ - no removal or new amalgam filling in pregnant an children
- ↳ - rubber dam and exhaustor by treatment with amalgam
- ↳ - amalgam only in capsules (machine-made mixing)
- ↳ - finishing, polishing with water-cooling
- ↳ - effective suction
- ↳ - amalgam separator at the unit
- ↳ - airing the room
- ↳ - contaminated cotton rolls - hazardous waste –closed storage

Dental amalgam: characteristic
and clinical use

↳ initial contraction (1 h)

↳ transient expansion (1-3 h)

↳ final contraction (24 h)

. flow 3-24 h

. creep after 24 h

↳ delayed expansion –

mercuroscopic expansion

Stages and steps in cavity preparation

Initial cavity preparation stage

1. Outline form and initial depth
2. Primary resistance form
3. Primary retention form
4. Convenience form

Final cavity preparation stage

Stages and steps in cavity preparation

- Final cavity preparation stage
 - 5. Removal of carious dentin and
 - 6. Pulp protection
 - 7. Secondary resistance and retention forms
 - 8. Finishing external walls
 - 9. Cleaning

Stages and steps in cavity preparation

1. Slightly rounded configuration
2. Convergence occlusally of vestibular and oral walls
3. Gingival wall is min 1.2mm wide
4. Occlusal width and depth of the restauration 1.5-2 mm
5. Gingival extension
6. Margin of the cavity cca 90°
7. V-shaped side-fissure

Restauration with amalgam

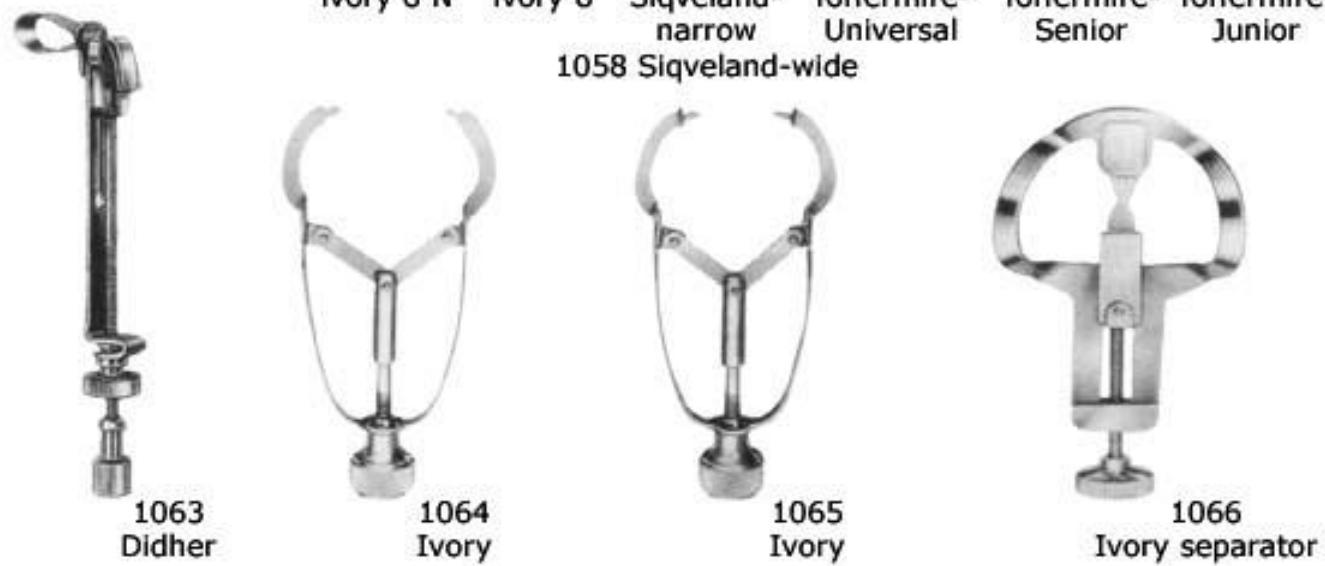

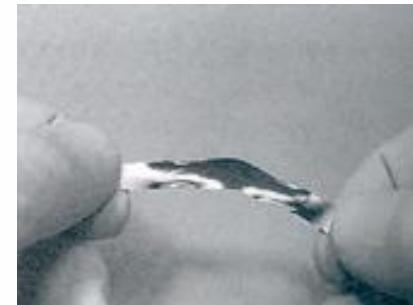

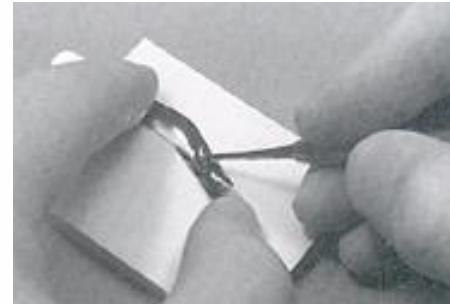

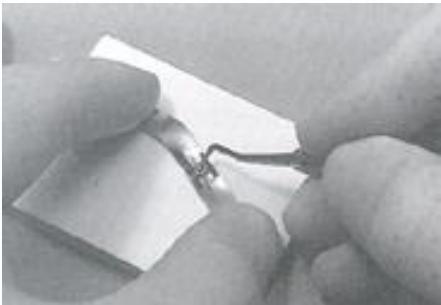

- ➡ Preparation of the cavity
- ➡ Isolation
- ➡ Matrices and matrix retainer
- ➡ Wedge placement
- ➡ Trituration
- ➡ Insertion, condensation
- ➡ Carving, burnishing

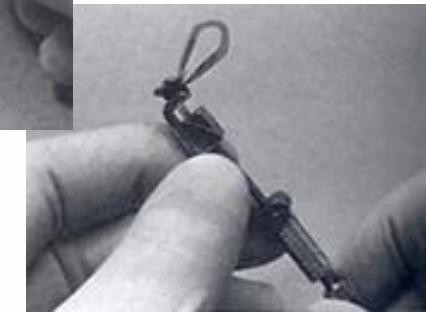

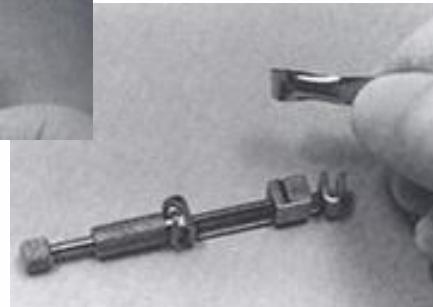

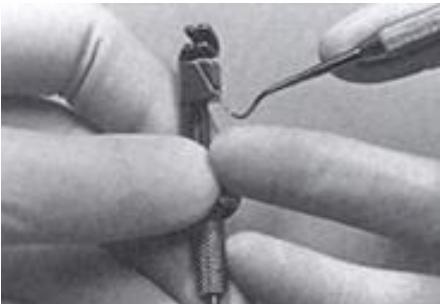

Finishing, polishing

Ass. Prof.
Dr. Zsuzsanna Tóth Ph.D.

Schrittfolge

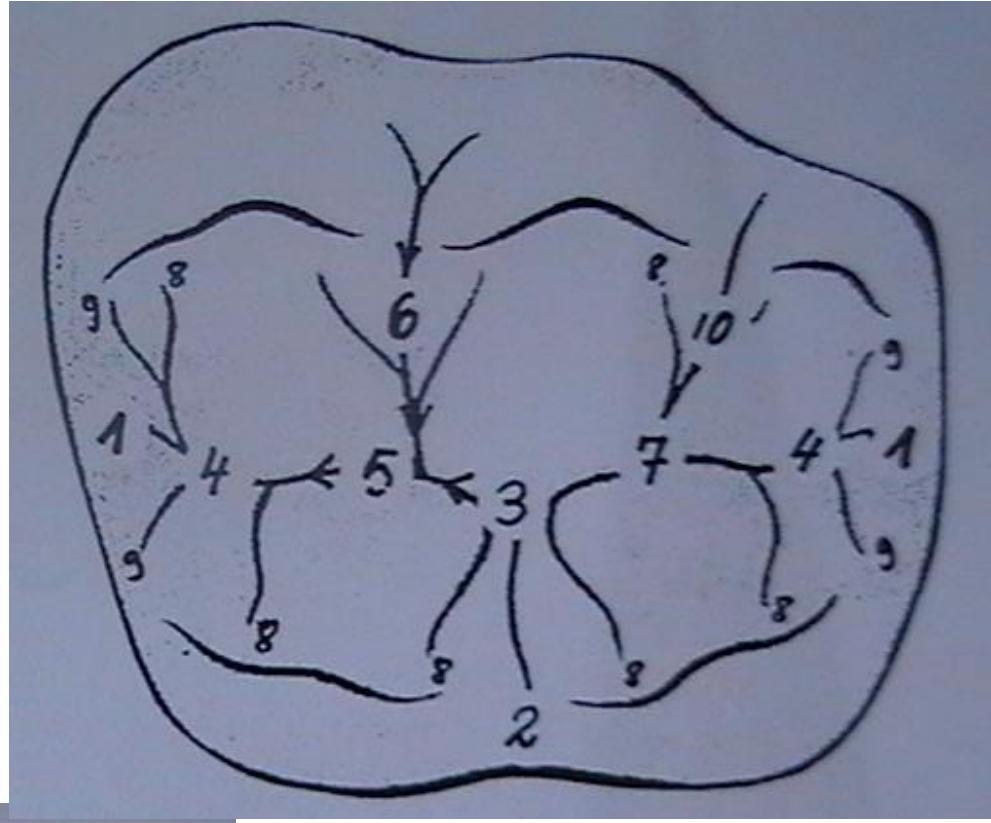

Beispiel 1. + 2. OK-Molar

1. Mesiale und distale Randleiste auf die Höhe zurückschneiden, die die Randleisten der Nachbarzähne aufweisen.
2. Von der Inzisur der nichttragenden Hocker zur zentralen Grube (3) hin schneiden und
3. die zentrale Grube mit genügender Tiefe anlegen.
4. Mesiale und distale Gruben neben den Randleisten anlegen.
5. Zentrale Grube (3) mit der mesialen Grube (4) verbinden
6. Inzisur aus der distalen Grube (4) nach palatinal hinausziehen (5)
7. Distale Grube (4) mit der zentralen Grube (3) verbinden
8. Unterteilung der Dreiecksleisten.
9. Unterteilung der Randleisten.
10. Balancespur freischnitten.
