

Action plan based on students' evaluation of lecturers for course development

42.1% of English students filled in the questionnaire and expressed their opinion on the educational performance of the department.

Although the department scored above in all aspects compared to the average of the faculty, we have prepared the following points to improve knowledge transfer to our students:

We will transform the topics of our practices so that they become more interactive. (e.g. practical demonstration of the methodology of saliva collection and analysis, practical demonstration of the PCR technique). Additionally, we will dedicate time for emphasizing the importance and demonstrating the analytical methods used in dental practice. We will improve the communication between the tutors and the students.

Our textbook will be improved with digital materials complying with blended learning.

We will ensure that lecture notes are available online prior to the lecture, so students can come prepared and get more involved in the courses.

We will provide opportunities for personal consultations at the end of each semesters (13th and 14th week).
