

# **Odontogenic inflammation I. Pathology, pathophysiology, and microbiology of pyogenic inflammations.**

# Histology of Actinomycosis

- **Odontogenic inflammation**
- **Dental inflammation**
- **Dental infections**
- **Odontogenic infections**

# **Inflammation: the reaction of tissues to different types of irritation, involving the whole organism**

- Local cell necrosis – demarcation of damaged tissues - replacement
- Liberation of histamine and H-substances, activation of kinine-kallikrein system
- Accumulation of Prostaglandins
- Leukotoxin: increasing of permeability, leukocyte migration
- Necrosin: necrosis of tissues
- Pyrexin: fever

# **Provocative agents**

- **Physical irritation (cold, hot)**
- **Mechanical irritation**
- **Chemical agents**
- **Hetero proteins**
- **Auto proteins (autoimmunisation)**
- **Infective agents**

# **Pathogenic agents (living agents)**

- **Bacteria, fungi, protozoa**
- **Virus**
- **Parasite, Rickettsia**

# Clinical features of inflammations

- calor, rubor, tumor, dolor (Celsus)

Elevated temperature, redness, swelling, pain

- functio laesa (Galenus)

Malfunction

# Phases of inflammation

- 1. Accelerated blood circulation, acute hyperaemia (fluxio)
- 2. Decelerated blood circulation, capillary dilatation (peristasis, hyperaemia)
  - Elevated permeability,
  - Protein-exudation
  - sticky capillary–endothelium:  
emigration of leukocytes

### ● 3.a. Exsudative- infiltrative phase

proteins, leukocytes

Immunoglobulines

phagocytosis

Exudation stops, resorption

healing

## ● 3.b. Proliferative – infiltrative phase

exudation

proliferation: histiocytes

lymphocytes

plasma cells

monocyte infiltration

## **3.a. or 3.b. Reasons**

- **Features of pathogenic agents**
- **Protective ability of the organism**
- **Humoral agents: modification of local reactions**  
**(prophlogistic, antiphlogistic)**

# **Specific –proliferative- inflammations**

- **Tuberculosis**
- **Syphilis**
- **AIDS**
- **Actinomycosis**
- **Tularaemia**

# **Classification of inflammations**

## ● **Type of exudate:**

- **Serous**
- **Fibrinous**
- **Purulent**
- **Haemorrhagic**
- **Necrotic**

# **Classification of inflammations**

- Acute
- Chronic
- Subacute

# Abscess

## Pus bonum et laudabile (Good and laudable pus)

- Circumscribed pus accumulation combined with tissue lysis
- Empyema: Pus accumulation in a preformed cavity
  - Paranasalium (in the maxillary sinus)
- Chronic abscess: bordered by a 1-2 mm wide yellow pyogenic membrane
- Fistulization

# Changes in blood count in inflammations

- **1. Stage (neutrophil reaction):**
  - Leukocytosis
  - Qualitative changes: ratio of neutrophils, stabs and early differentiated cells is elevated
  - Ratio of eosinophils is decreased
- **2. Stage (monocytic protective):**
  - Number of monocytes increased
  - Number of leukocytes and granulocytes decreased
- **3. Stage (lymphocytic healing):**
  - Ratio of lymphocytes elevated
  - Number of leukocytes decreased more
  - Early differentiated cells disappeared
  - Number of eosinophils increased

# **Changes of blood count in dental inflammations**

- **NB: Changes are characteristic in extradental inflammations!**
- **Elevated sedimentation: 85%**
- **Leukocytosis: 60%**
- **Absence of Eosinophils : 50%**

# **Microbiology of infections in the oral cavity**

- **92-94% odontogenic origin**
- **Pathogenic agents: 70-80%: mainly anaerobe, mixed flora**
  - **Components: Gram-positive + negative, obligate and facultative anaerobe bacteria**
  - **Streptococci, Staphylococci relatively rarely**

# Microbiology

- Streptococcus (alfa-haemolyticus)
- Streptococcus pyogenes (n.normal Flora)
- Staphylococcus aureus (n.normal Flora)
- Neisseria
- Actinomyces genus
- Fusobacterium species
- Treponema microdentium

# Therapy of infections

- Endodontic
- Endodontic + excochleation
- Endodontic + apicectomy
- Incision + endodontic + apicectomy
- Extraction
- Physiotherapy: laser (soft)  
US  
SW  
IR  
packing

# Antibiotic therapy

penicillin

clindamycin

metronidazol

macrolid

- Aktil-Duo, Augmentin, Ciprobay, Dalacin C, Duomox, Klacid, Klion, Rovamycin, Pyassan

# Packing /hydrotherapy/

- **Compress (cold):**

- Decreasing of oedema
- Painkiller effect

- **Wet pack**

- Cream (fatty e.g.petrolatum)
- Wet cotton
- Plastic foil
- Dry cotton (thick)
- Fixing

**Thank you for your  
attention**
